Optional Change Management provides additional change management support for items customers are not likely to encounter on a daily basis.

Optional Change Management items are charged on a per-incident basis (NRC), and are available to customers that subscribe to 6.3.3.8 IP and Network IP Transport Services. These are enhanced features and a subset of the 6.3.3.8 IP and Network IP Transport Services.

Optional Change Management Activities:

Feature Name	Feature Identifier	Unit of Measure	Unit Non-Recurring	Unit Recurring	Change Charges
Management (Router-remote labor configuration) Dynamic Host Configuration Protocol ("DHCP") IP Helper - Add / Modify / Delete	IPMW0012	Per Occurrence	N/A	N/A	\$42.50

Private IP Secure Gateway Services (Secure Gateway Universal Port - data only not to be used for voice) is a suite of services that includes the three components listed below through a single network based port. This section includes optional managed services for Remote Office connectivity.

Secure Gateway Firewall - provides enterprise employees secure access to the Internet from customer locations connected to private networks via a network-based firewall. Secure Gateway- Firewall is available with Private IP. This service extends the power of Verizon's private networks to safely provide Internet access without the requirement of multiple links and premise based firewalls. Secure Gateway Firewall bundles access with a "stateful firewall" to help protect against a range of network security threats. The network-based firewall inspects and tracks all inbound and outbound data streams, allowing passage of only those packets that match a known and authorized state. Stateful firewalls help improve the security and performance of more traditional packet filters because they capture and hold attributes of each data stream for the entire length of the connection.

Secure Gateway Mobile User – provides secure, encrypted, remote access to the customers' private network for their mobile workforce and remote employees. Mobile User is enabled by geographically-dispersed network gateways deployed at Verizon points of presence (PoPs). The service provides remote access through an exclusively-provisioned port between the customer's private network and the company's public IP network. Remote sites use Verizon or third-party dial, DSL or cable to connect to the Verizon IP backbone or the Internet. Then, using a VPN software client, the remote site automatically establishes a secure IPsec tunnel, through the IP network to the Secure Gateway Port located on a Verizon network gateway. The VPN client allows optional split tunneling for flexible end-user access to the customer's private network only, or to both their private network and the public Internet.

Secure Gateway Remote Office – creates a secure end-to-end logical link between corporate resources or corporate "hubs" on the Verizon network and remote sites connected to the Internet or Verizon's IP network via low cost broadband or T1 access. Verizon network service "hubs" are typically data centers, corporate headquarters, regional offices and other locations hosting mission-critical enterprise servers. Secure Gateway Remote Office utilizes Cisco technology for the hardware client, the Universal Port, or network gateway and the EasyVPN feature of the IOS operating system. Secure Gateway Remote Office leverages industry standard security protocols - IPsec, 3DES, and AES encryption and is an ideal solution for customers with sensitive price points and ease-of-implementation requirements.

Dial Access is an IP dial access service offering that is designed for large corporations or organizations that have remote, roaming, or branch office users and/or contractors. Dial Access uses the public Dial Access Network (DAN) POPs. It provides an excellent infrastructure for remote analog to a business intranet, extranet or virtual private network (VPN). The service provides remote users with a low-cost, dial-up, point-to-point protocol (PPP) connection to the Internet.

6.3.4.3a Converged Services, Internet Dedicated Access (IDA) Service Attachment 4

Customer Provided Access Charges: Network Connection Charge (NCC):

NCC is a customer-provided access charge that covers the administrative, entrance facility reconfiguration, and network maintenance cost associated with connecting to any of Verizon's network services. The customer would make the arrangements with the telco to have their access circuit terminated to Verizon's network POP, based on the CFA Verizon gives them.

For customer-provided access, the LEC or CLEC is responsible for terminating and maintaining the access circuit connection all the way to the Verizon network POP. NCC will apply to all customer-provided access circuits other than a Verizon or affiliated company installed.

Feature Name	Feature Identifier	Change Identifiers	Unit of Measure	Unit Non - Recurring	Unit Recurring	Change Charges
DDS or DS0	CSDD0000	CHDD0000	Per NCC	\$0.00	\$51.00	ICB
T1	CSDT0001	CHDT0001	Per NCC	\$0.00	\$195.50	ICB
DS3	CSDS0003	CHDS0003	Per NCC	\$0.00	\$1,466.25	ICB
OC12	CSOC0012	CHOC0012	Per NCC	\$0.00	\$2,932.50	ICB

Internet Access Cross-Connect

An Internet access cross-connect is a point-to-point intra-building dedicated circuit used to connect customers to the Verizon IP Network. Apply Internet access cross-connect charges in place of traditional Local Loop charges when the following configuration requirements exist:

1. A customer requires a connection between the Verizon IP Network and the customer's Network Colocation space within the same lit building.
2. A customer requires a connection between the Verizon IP Network and the customer's alternative provider's colocation space within the same Verizon lit building.
3. A customer requires a connection between the Verizon IP Network and the customer's location within the same Verizon lit building.

Exception: Where facilities exist, Verizon will provide the Internet Access cross-connects as previously described. If facilities do not exist, time and material charges to construct facilities within the building apply.
